Overview

This is the metric dictionary for the **Sustainability & Workplace Efficiency** dashboards. It lists every KPI shown across the Employee, Manager and HR views: what it measures, the exact formula, how the number is computed, and the real-world system it would come from if we had production data access.

Three conventions apply to almost every entry below, so they are stated once here rather than repeated.

Shared conventions

- **Aggregation.** Anything weekly is first averaged *per person*, then averaged across people. This stops someone with 52 records from outweighing someone with 12. Percentages and rates are averaged as rates, never re-derived from pooled totals unless the formula says otherwise.
- **Direction.** Each KPI is tagged higher-is-better or lower-is-better. The tag flips the ranking automatically, so “best” always means best for the business.
- **Benchmarks.** Every KPI can show a *Company average* (the mean of every employee’s own value for that metric), a *Department average*, and a *standing*.

Benchmark mechanics

Used by every “vs company” figure and every standing chip in the tables.

```
rank        = 1 + COUNT(peers better than you)
percentile  = COUNT(at or above you) / peers × 100
standing    = Top 10%    if percentile ≥ 90
              Top 25%    if percentile ≥ 75
              Above avg  if percentile ≥ 50
              Below avg  if percentile ≥ 25
              Bottom 25% otherwise
```

Comparison direction flips automatically for lower-is-better metrics.

CONFIDENTIAL

Core KPIs — individual and team

These eight appear on the Employee and Manager dashboards.

1. Working Hours

Measures. The average hours an employee actually worked per week. A standard day is 8h, so a typical week lands near 40h. This is a context metric, not a scored one.

Formula

```
hours_worked = AVG(Hours_Worked)        # per person, across weekly records

weekly chart = SUM(Hours_Worked) that week
               (dashed line = MEAN across all employees that week)
```

How it is calculated. Each weekly record carries a logged-hours value. The KPI is the mean of those values for the person. The trend chart plots the weekly total against the company mean total for the same week.

Real-world source. Hybrid-work and time tracking: badge access (Lenel, Workspace ONE), VPN and SSO session logs, desk-booking (Condeco, Robin), or a time system (Clockify, Jira worklogs). Weekly grain.

Direction. Neutral. Shown for workload balance, with no rank pressure.

2. Employee Engagement

Measures. The average weekly engagement pulse, on a 1 to 5 scale.

Formula

```
engagement_score = AVG(Engagement_Score)     # personal 1–5 pulse

weekly chart     = AVG(Engagement_Score) per week
                   (dashed = company avg that week)
```

CONFIDENTIAL

How it is calculated. Each employee's weekly pulse responses are averaged into one personal score. The company average is the mean of all those personal scores.

Real-world source. A weekly pulse survey: Culture Amp, Qualtrics, Microsoft Viva Glint, or 15Five. One 1 to 5 item per week, for example "I feel engaged and motivated."

Direction. Higher is better. A sustained drop is the burnout and disengagement flag.

3. Meeting Hours

Measures. The hours an employee spent organising meetings, counted as person-hours in the meetings they own.

Formula

```
meeting_hours = SUM(Duration_Minutes) / 60
```

How it is calculated. Every meeting is attributed to its organiser. Durations are summed and divided by 60. The company average is the same total for a typical organiser.

Real-world source. Microsoft Graph and Teams calendar (or Google Calendar, Zoom). Each event carries an organiser, attendees and duration.

Direction. Lower is better. Fewer person-hours consumed.

4. Meeting Attendance

Measures. The share of invited people who actually showed up to the meetings an employee organised.

Formula

```
attendance_rate = SUM(Attended_Count) / SUM(Invited_Count)
```

How it is calculated. Across all of a person's meetings, total attendees divided by total invitees. The company average is the same ratio per organiser, then averaged.

CONFIDENTIAL

Real-world source. Teams meeting attendance report (Graph API `attendanceReports`), or Zoom participant reports.

Direction. Higher is better. Low attendance signals mis-scheduled or low-value meetings.

5. Meeting Efficiency

Measures. A transparent 1 to 5 index rebuilt from three directly measurable meeting signals. This replaced the earlier opaque column.

Formula

```
efficiency = 1 + 4 × ( 0.40 · attendance_rate
                     + 0.35 · action_completion_rate
                     + 0.25 · short_meeting )

attendance_rate        = SUM(Attended_Count) / SUM(Invited_Count)
action_completion_rate = SUM(Completed_Action_Items) / SUM(Action_Items)
short_meeting          = share of meetings with Duration_Minutes ≤ 60
```

How it is calculated. Each component is normalised to 0 to 1, weighted 40 / 35 / 25, then mapped onto a 1 to 5 scale. Where a meeting has no action items (`Action_Items = 0`), that component is treated as a neutral 0.5 so empty notes do not penalise the score. The recompute is centralised in one function (`compute_efficiency` / `meetings_frame` in `backend/routes/employee.py`) and reused by all routes.

Real-world source. Derived entirely from Teams and Graph data: attendance reports, meeting notes or Planner tasks for action items, and event durations. Every input is extractable, so the index is auditable.

Direction. Higher is better. Feeds the composite index at weight × 20.

6. Learning Completion

Measures. How much of the learning assigned to an employee they actually finished.

Formula

```
completion_rate = AVG(Completed_Hours / Assigned_Hours)     # per course, then
per person
```

How it is calculated. Each course yields a completion ratio. Ratios are averaged per person, then across people. The company average is the mean of everyone’s completion percentage.

Real-world source. The LMS: Workday Learning, Cornerstone, Docebo, SuccessFactors Learning. Fields: assigned hours, completed hours, course status.

Direction. Higher is better. You finish what you are given. Related sub-metrics: learning hours, assessment score, certifications, learning points.

7. Performance Rating

Measures. The average overall performance review score, out of 5.

Formula

```
performance_rating = AVG(Overall_Rating)     # across a person's reviews
```

How it is calculated. A person’s review ratings are averaged into one value. The company average is the mean of those personal averages. Rank compares the person to all peers.

Real-world source. The HR performance module: Workday, SAP SuccessFactors, BambooHR, or Lattice. Field: overall rating per review cycle.

Direction. Higher is better. Feeds the composite index at weight × 20, one of the heaviest bands.

8. Goal Progress

Measures. The average completion percentage across an employee’s goals.

Formula

CONFIDENTIAL

```
goal_progress = AVG(Progress_Percentage)
```

How it is calculated. The progress field of every goal is averaged per person. The company average is the mean of every employee’s goal progress. Related metrics: goal achievement rate, goals completed rate, overdue count.

Real-world source. An OKR or goals tracker: Lattice, 15Five, Betterworks, Workday Goals, or Jira and Asana for delivery goals.

Direction. Higher is better. Feeds the composite index at weight × 1.

CONFIDENTIAL

HR KPIs — company-wide

These three appear on the HR dashboard and drive the executive view.

9. High Priority Overdue Goals

Measures. The count of goals that are both overdue and high priority. This is the sharpest risk signal in the goal book.

Formula

```
count = COUNT(status = 'Overdue' AND priority = 'High')     # company-wide
```

How it is calculated. A pure count across all employees' goals. No averaging.

Real-world source. The same OKR and goals tracker (status and priority fields).

Direction. Lower is better.

10. At-Risk Employees

Measures. The number of employees whose average performance rating sits below 3.2. In the UI this is softened to **"Workload & focus watch"**. It is a support signal, not a punishment list.

Formula

```
count = COUNT( employees where AVG(Overall_Rating) < 3.2 )
note  = first three names, for a human check-in
```

How it is calculated. Each employee's reviews are averaged. Anyone under the 3.2 threshold is counted. The accompanying note lists the first few names so HR can act, not just see a number.

Real-world source. HR performance reviews, as in KPI 7.

CONFIDENTIAL

Direction. Lower is better.

11. Average Performance Index

Measures. The company-wide mean of the composite index. This is the headline benchmark every department and manager is measured against.

Formula

```
avg_index = MEAN( composite index of all employees )

composite = MEAN( clamp(component × weight, 0, 100) )

  performance_rating    × 20      engagement_score      × 20
  wellbeing_score       × 20      meeting_efficiency    × 20
  goal_progress         ×  1      learning_completion   ×  1
  goal_achievement_rate ×  1
```

How it is calculated. Each component is multiplied by its weight, clamped to 0 to 100, and the mean of all available components gives a person’s 0 to 100 index. Employees missing a component average only the ones they have. The company index is the mean of everyone’s index.

Real-world source. Derived. It blends review, survey, meeting and learning data, so it has no single source. It is intentionally transparent: the exact same formula appears on all three dashboards.

Direction. Higher is better. This is the benchmark for every department.

CONFIDENTIAL

Supporting inputs

These feed the KPIs above and are worth naming explicitly.

Input	Formula	Source
Action completion rate	`SUM(Completed_Action_Items) / SUM(Action_Items)`	Teams notes / Planner
Long-meeting share	`COUNT(Duration > 60) / COUNT(meetings)`	Graph calendar
Meeting cost-hours	`SUM(Duration_Minutes × Attended_Count) / 60`	Derived from calendar
Focus hours	`AVG(Focus_Hours)`	Calendar analytics (Viva-Insights style)
Collaboration hours	`AVG(Collaboration_Hours)`	Calendar analytics
Wellbeing	`AVG(Wellbeing_Score)` (1–5)	Weekly pulse survey
Goal achievement	`AVG(Goal_Achievement_Rate)`	Reviews / OKR tool

CONFIDENTIAL

Source-system map

If we had real access, these are the systems that would populate the warehouse.

System	Provides
HRIS (Workday, BambooHR, SuccessFactors)	Roster, department, location, tenure, employment status
Performance module	Overall rating, goal achievement rate
LMS (Workday Learning, Cornerstone)	Assigned and completed hours, course status, assessment score
Pulse survey (Culture Amp, Qualtrics, Viva Glint)	Engagement, wellbeing (weekly 1–5)
Microsoft Graph / Teams (or Zoom, Google)	Meetings, durations, attendance, action items
Hybrid-work tracker (badge, VPN, desk-booking)	Hours worked, office and remote days, focus vs collaboration
OKR and goals tool (Lattice, 15Five, Betterworks, Jira, Asana)	Goal progress, status, priority
Smart meters and commute survey	CO_2, renewable share (currently deferred and hidden in the UI)

CONFIDENTIAL

Notes

- **Sustainability is deferred.** CO_2, commute distance and renewable share still exist in the code but are hidden in the UI. The composite index deliberately does **not** fold sustainability in.
- **Customer-facing naming.** Internal keys such as `at_risk` and `low_performance_by_department` are unchanged; only the display labels were softened to avoid blame language.
- **Compositing.** The composite index is the mean of clamped weighted components, so a person strong in reviews and engagement lifts the company index even if one component is missing.
